CLAIMS

1-29. (Canceled)

- 30. (New) An interface circuit for interfacing between a pair of subscriber tip/ring lines and a central office of a telecommunications network, the interface circuit comprising:
- (a) filter circuitry configured to separate low-frequency and high-frequency signals appearing on the tip/ring lines, wherein the filter circuitry comprises a blocking capacitor that affects the impedance of the tip/ring lines;
 - (b) high-frequency interface circuitry configured to process the high-frequency signals;
- (c) low-frequency interface circuitry configured to process the low-frequency signals, wherein the low-frequency interface circuitry comprises:
- (1) a subscriber line interface circuit (SLIC) configured between the tip and ring lines; and
- (2) a coder/decoder (CODEC) coupled to the SLIC and configured to encode and decode the low-frequency signals;
- (d) a capacitor cancellation circuit (CCC) coupled across the blocking capacitor and adapted to generate a first single-ended signal, which is applied to the SLIC and coupled via the SLIC and the filter circuitry to the tip/ring lines to cancel a portion of the effect of the blocking capacitor on the impedance of the tip/ring lines.
- 31. (New) The invention of claim 30, wherein the cancellation provided by the CCC provides a desired impedance between the tip/ring lines for both the low-frequency and high-frequency signals.
- 32. (New) The invention of claim 31, wherein the desired impedance has a resistance of about 900 ohms and a capacitance of about 2.16 microfarads.
- 33. (New) The invention of claim 30, wherein the portion canceled by the CCC corresponds to at least about 90% of the effect induced by the blocking capacitor.
 - 34. (New) The invention of claim 30, wherein the CCC comprises:
- a first converter adapted to sense a differential voltage across the blocking capacitor and generate a single-ended capacitance signal that reflects the capacitance of the blocking capacitor; and
- a low-pass filter adapted to filter out components of the single-ended capacitance signal corresponding to the high-frequency signals to generate the first single-ended signal.
- 35. (New) The invention of claim 34, wherein the CODEC is coupled to the SLIC via a second converter adapted to convert a pair of differential signals generated by the CODEC into a second single-ended signal applied to the SLIC.
- 36. (New) The invention of claim 34, wherein the first converter comprises an operational amplifier having two inputs coupled across the blocking capacitor and an output coupled to the low-pass filter.
 - 37. (New) The invention of claim 36, wherein the first converter comprises:
- a first capacitor and a first resistor coupled in series between a non-inverting input of the operational amplifier and a first terminal of the blocking capacitor;
- a second capacitor and a second resistor coupled in series between an inverting input of the operational amplifier and a first terminal of the blocking capacitor;

- a third capacitor and a third resistor coupled in parallel between the inverting input and the output of the operational amplifier; and
- a fourth capacitor and a fourth resistor coupled in parallel between the non-inverting input of the operational amplifier and the SLIC.
 - 38. (New) The invention of claim 34, wherein the low-pass filter is a fourth-order filter.
- 39. (New) The invention of claim 38, wherein the low-pass filter comprises two serially connected second-order filters.
- 40. (New) The invention of claim 30, wherein: the high-frequency signals correspond to DSL signals having frequencies greater than about 4 kHz;

the low-frequency signals correspond to POTS signals having frequencies less than about 4 kHz; and

the filter circuitry comprises (i) a high-pass filter configured to provide the DSL signals to the high-frequency interface circuitry and (ii) a low-pass filter configured to provide the POTS signals to the low-frequency interface circuitry, wherein the blocking capacitor is part of the high-pass filter.

- 41. (New) A capacitor cancellation circuit (CCC) for an interface circuit for interfacing between a pair of subscriber tip/ring lines and a central office of a telecommunications network, the interface circuit comprising:
- (a) filter circuitry configured to separate low-frequency and high-frequency signals appearing on the tip/ring lines, wherein the filter circuitry comprises a blocking capacitor that affects the impedance of the tip/ring lines;
 - (b) high-frequency interface circuitry configured to process the high-frequency signals;
- (c) low-frequency interface circuitry configured to process the low-frequency signals, wherein the low-frequency interface circuitry comprises:
- (1) a subscriber line interface circuit (SLIC) configured between the tip and ring lines; and
- (2) a coder/decoder (CODEC) coupled to the SLIC and configured to encode and decode the low-frequency signals;
- (d) the capacitor cancellation circuit (CCC) coupled across the blocking capacitor and adapted to generate a first single-ended signal, which is applied to the SLIC and coupled via the SLIC and the filter circuitry to the tip/ring lines to cancel a portion of the effect of the blocking capacitor on the impedance of the tip/ring lines.
- 42. (New) The invention of claim 41, wherein the cancellation provided by the CCC provides a desired impedance between the tip/ring lines for both the low-frequency and high-frequency signals.
- 43. (New) The invention of claim 41, wherein the portion canceled by the CCC corresponds to at least about 90% of the effect induced by the blocking capacitor.
 - 44. (New) The invention of claim 41, wherein the CCC comprises:
- a first converter adapted to sense a differential voltage across the blocking capacitor and generate a single-ended capacitance signal that reflects the capacitance of the blocking capacitor; and
- a low-pass filter adapted to filter out components of the single-ended capacitance signal corresponding to the high-frequency signals to generate the first single-ended signal.

- 45. (New) The invention of claim 44, wherein the CODEC is coupled to the SLIC via a second converter adapted to convert a pair of differential signals generated by the CODEC into a second single-ended signal applied to the SLIC.
- 46. (New) The invention of claim 44, wherein the first converter comprises an operational amplifier having two inputs coupled across the blocking capacitor and an output coupled to the low-pass filter.
 - 47. (New) The invention of claim 46, wherein the first converter comprises:
- a first capacitor and a first resistor coupled in series between a non-inverting input of the operational amplifier and a first terminal of the blocking capacitor;
- a second capacitor and a second resistor coupled in series between an inverting input of the operational amplifier and a first terminal of the blocking capacitor;
- a third capacitor and a third resistor coupled in parallel between the inverting input and the output of the operational amplifier; and
- a fourth capacitor and a fourth resistor coupled in parallel between the non-inverting input of the operational amplifier and the SLIC.
 - 48. (New) The invention of claim 44, wherein the low-pass filter is a fourth-order filter.
- 49. (New) The invention of claim 48, wherein the low-pass filter comprises two serially connected second-order filters.
- 50. (New) An interface circuit for interfacing between a pair of subscriber tip/ring lines and a central office of a telecommunications network, the interface circuit comprising:
- (a) filter circuitry configured to separate low-frequency and high-frequency signals appearing on the tip/ring lines, wherein the filter circuitry comprises a blocking capacitor that affects the impedance of the tip/ring lines;
 - (b) high-frequency interface circuitry configured to process the high-frequency signals;
- (c) low-frequency interface circuitry configured to process the low-frequency signals, wherein the low-frequency interface circuitry comprises:
- (1) a subscriber line interface circuit (SLIC) configured between the tip and ring lines; and
- (2) a coder/decoder (CODEC) coupled to the SLIC and configured to encode and decode the low-frequency signals;
- (d) a capacitor cancellation circuit (CCC) coupled across the blocking capacitor and adapted to cancel a portion of the effect of the blocking capacitor on the impedance of the tip/ring lines, wherein the CCC comprises:

an operational amplifier having (i) an inverting input coupled to a first terminal of the blocking capacitor, (ii) a non-inverting input coupled to a second terminal of the blocking capacitor, and (iii) an output coupled back to the first and second terminals of the blocking capacitor; and

an inverter coupled between the output of the operational amplifier and the first terminal of the blocking capacitor.

- 51. (New) The invention of claim 50, wherein the CCC further comprises:
- a first capacitor and a first resistor coupled in series between the inverting input of the operational amplifier and the first terminal of the blocking capacitor;
- a second capacitor and a second resistor coupled in series between the non-inverting input of the operational amplifier and the second terminal of the blocking capacitor;

- a third capacitor and a third resistor coupled in parallel between the inverting input and the output of the operational amplifier; and
- a fourth capacitor and a fourth resistor coupled in parallel between the non-inverting input of the operational amplifier and a ground terminal.
 - 52. (New) The invention of claim 51, wherein the CCC further comprises:
- a fifth capacitor and a fifth resistor coupled in series between the output of the operational amplifier and the second terminal of the blocking capacitor; and
- a sixth capacitor and a sixth resistor coupled in series between the inverter and the first terminal of the blocking capacitor.
- 53. (New) The invention of claim 50, wherein the cancellation provided by the CCC provides a desired impedance between the tip/ring lines for both the low-frequency and high-frequency signals.
- 54. (New) The invention of claim 53, wherein the desired impedance has a resistance of about 900 ohms and a capacitance of about 2.16 microfarads.
- 55. (New) The invention of claim 50, wherein the portion canceled by the CCC corresponds to at least about 90% of the effect induced by the blocking capacitor.
- 56. (New) The invention of claim 50, wherein: the high-frequency signals correspond to DSL signals having frequencies greater than about 4 kHz;

the low-frequency signals correspond to POTS signals having frequencies less than about 4 kHz; and

the filter circuitry comprises (i) a high-pass filter configured to provide the DSL signals to the high-frequency interface circuitry and (ii) a low-pass filter configured to provide the POTS signals to the low-frequency interface circuitry, wherein the blocking capacitor is part of the high-pass filter.

- 57. (New) A capacitor cancellation circuit(CCC) for an interface circuit for interfacing between a pair of subscriber tip/ring lines and a central office of a telecommunications network, the interface circuit comprising:
- (a) filter circuitry configured to separate low-frequency and high-frequency signals appearing on the tip/ring lines, wherein the filter circuitry comprises a blocking capacitor that affects the impedance of the tip/ring lines;
 - (b) high-frequency interface circuitry configured to process the high-frequency signals;
- (c) low-frequency interface circuitry configured to process the low-frequency signals, wherein the low-frequency interface circuitry comprises:
- (1) a subscriber line interface circuit (SLIC) configured between the tip and ring lines; and
- (2) a coder/decoder (CODEC) coupled to the SLIC and configured to encode and decode the low-frequency signals;
- (d) the capacitor cancellation circuit (CCC) coupled across the blocking capacitor and adapted to cancel a portion of the effect of the blocking capacitor on the impedance of the tip/ring lines, wherein the CCC comprises:

an operational amplifier having (i) an inverting input coupled to a first terminal of the blocking capacitor, (ii) a non-inverting input coupled to a second terminal of the blocking capacitor, and (iii) an output coupled back to the first and second terminals of the blocking capacitor; and

an inverter coupled between the output of the operational amplifier and the first terminal of the blocking capacitor.

- 58. (New) The invention of claim 57, wherein the CCC further comprises:
- a first capacitor and a first resistor coupled in series between the inverting input of the operational amplifier and the first terminal of the blocking capacitor;
- a second capacitor and a second resistor coupled in series between the non-inverting input of the operational amplifier and the second terminal of the blocking capacitor;
- a third capacitor and a third resistor coupled in parallel between the inverting input and the output of the operational amplifier; and
- a fourth capacitor and a fourth resistor coupled in parallel between the non-inverting input of the operational amplifier and a ground terminal.
